| Project Title | Deepfake Detection |
| <p>Brief Description of Project:</p> <p>Deepfake detection is a rapidly growing field that aims to detect and prevent the spread of manipulated videos, also known as deepfakes. These videos use advanced AI algorithms to manipulate the appearance of a person in a video, making it appear as if they said or did something that they did not.</p> <p>Detection using Machine Learning: This technique uses deep learning to train models to detect deepfakes by analyzing the image and video frames, comparing the frames with real videos, and identifying anomalies.</p> | |
| Platform | Deep Learning |
| Front End Tools | HTML, PHP |
| Back End Tools | Machine Learning Algorithm |

Date of Submission: 30/01/2023
